

I am not for bpl, because of one thing. Even with small amount of rf used, it will become additive when more lines are added to bpl system. Just like a high gain antennas used to receive or transmitte ,this near random noise would flood the sky wave with noise. This would make most radio systems useless for any type of lone range commucations. A case in point is CB radios , even with only 5 watts of a few 100,000 radios. The noise level is so high only short range commucations is possible. But with bpl, we are not talking about a few 100 companies but over 100,000,000 line transmitters transmitting over 100 mw each, over 2 to 30 mhz. The noise level would be like the CB bands on a bad day.

So please, think about it...

Thank you for your time..
